Ecoline™ Product Line:  
**Channel Brush Turboline®**

## Welcome to the World of Technical Brushes

SAJAS GROUP is a forerunner in the manufacturing of technical brushes in the world. Its success is based on high quality products and continuous product research and development. As a result of the development the worldwide known Ecoline™ product family represents the top of the field of technical brushes in its production technology, performance and its environmental properties.

As an indication of the dynamics of 65-years old Sajakorpi Oy, many worldwide patents and design patents have been granted to its products and production methods. The vision of the family owned corporate now in the third generation is to become the most desired brush brand in the world. Today, Sajas Group serves their customers in more than 30 countries all over the world.

### Channel Brush Turboline®

The revolution for you sweeper

Turboline® is a channel brush consisting of an installation plate and interchangeable tufts. It offers you absolutely everything you can wish for with a channel brush. The brushing performance is considerably better than that of a conventional channel brush because of its tufts. Also the durability of the brush is increased considerably - it lasts at least twice as long thanks to the amount of the brushing material.

Interchangeable tufts make replacing the brush very swift and effortless. The mounting plate is installed permanently to the sweeper so you won't need to pay for a new plate every time you change your brushes anymore. Polypropylene and flat steel tufts are produced with variable filament diameters

and those can be combined freely to achieve desired sweeping result.

As all Ecoline™ products, Turboline® also includes many environmental benefits as well. Interchangeable tufts are packed very tight in cardboard boxes. It spares up to 80 % in terms of expenses in packing, stocking and transporting. The way of packing also preserves the quality of the tufts. Thanks to the compact package the interchangeable tufts can be carried in the cabin. You no longer have to drive back to the workshop only to change the brush. You can change the worn-out tufts where ever you are!

# Ecoline™

## Cleaning our environment

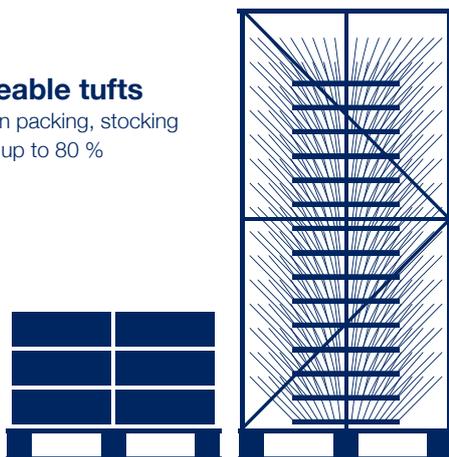

Materials and structures of all Ecoline™ products have been chosen to diminish waste and increase recycling. The full plastic brushes can be disposed in a recycling collection point. Re-granulated raw material can be used to produce new products. Due to polypropylenes good heat value it is suitable for creating heat energy by incineration amongst community waste. The full metal brushes can be recycled along with other metals.

The majority of used brushes end up at waste tips and therefore some countries have a special waste disposal fee. Preserving your own living environment doesn't limit only to using renewable energy sources or emission trading. Every one of us can influence with our own choices. This course is known as sustainable development. Have you experienced the difference between a conventional brush and an Ecoline™ brush? Preserve nature, money and yourself. USE THE DIFFERENCE!

### Interchangeable tufts

spare expenses in packing, stocking and transporting up to 80 %

... with our recyclable brushes.
