

Cleaning our environment...

Ecoline™ Product Line:
Flat Brush Ring Sunline™

Welcome to the World of Technical Brushes

SAJAS GROUP is a forerunner in the manufacturing of technical brushes in the world. Its success is based on high quality products and continuous product research and development. As a result of the development the worldwide known Ecoline™ product family represents the top of the field of technical brushes in its production technology, performance and its environmental properties.

As an indication of the dynamics of 65-years old Sajakorpi Oy, many worldwide patents and design patents have been granted to its products and production methods. The vision of the family owned corporate now in the third generation is to become the most desired brush brand in the world. Today, Sajas Group serves their customers in more than 30 countries all over the world.

Flat Brush Ring Sunline™ The new standard

Sunline™ is flat version of the Ecoline™ brush ring made of 100% polypropylene. It is designed to be used with distance rings. A guaranteed exact inner diameter of the brush ring ensures an even wear of the broom. Sunline™ is compatible with all sweepers using a brush ring system.

Full plastic Sunline™ brush rings can be used in all weathers. The bristles can withstand extremely cold temperatures without breaking. Corrosion is not conceivable with the Sunline™ system. Sunline™ brush rings are lighter when compared with traditional brushes, which reduces the sweeper weight.

As all Ecoline™ products, the Sunline™ also includes many environmental benefits as well. Full plastic brush rings won't rust so they can be stored inside or outside. Brush rings are packed for easy handling. The way of packing also preserves the quality of the brush rings.

Ecoline™

Cleaning our environment

Materials and structures of all Ecoline™ products have been chosen to diminish waste and increase recycling. The full plastic brushes can be disposed in a recycling collection point. Regranulated raw material can be used to produce new products. Due to polypropylenes good heat value it is suitable for creating heat energy by incineration amongst community waste. The full metal brushes can be recycled along with other metals.

The majority of used brushes end up at waste tips and therefore some countries have a special waste disposal fee. Preserving your own living environment doesn't limit only to using renewable energy sources or emission trading. Every one of us can influence with our own choices. This course is known as sustainable development. Have you experienced the difference between a conventional brush and an Ecoline™ brush? Preserve nature, money and yourself. **USE THE DIFFERENCE!**

... with our recyclable brushes.
